#### **MD+ Games**

# **CD** bios loading function

This function is related to the external Mega-CD and designed to play multi region CD images. Simply it can swap the internal CD bios to the file loaded from SD card. Just select required bios file in the file browser and launch it like any other game. Along with this function cartridge will activate the ram cart function for your Mega-CD.

# **IPS** patcher

The built-in auto patcher engine allows you to use IPS patches without using patching software. The ROM stays unchanged on the SD card but patched in cart RAM. Patch file should be located in the same folder with ROM file and ips file name should match to the ROM name.

#### Menu Themes

Cartridge supports user interface customization. Few basic themes stored in the system folder. Use the theme maker tool to create your own themes: https://krikzz.com/pub/support/megaeverdrive/pro-series/megatheme/

#### Limitations

- Always use ROMs which match the console region if possible. Using PAL ROMs on NTSC systems or visa versa may cause various glitches. PAL ROMs were designed for European system, NTSC ROMs are for US and Japanese systems.
- There is no cartridge audio channels on Nomad and Genesis3 due the lack of audio inputs on cartridge port.
- SMS games do not work in pair with 32X due the SMS mode lock by the 32X hardware.
- SMS games do not work on Nomad and Genesis3 due the lack of SMS mode on these systems.
- In-game menu in SMS games does not work on One-chip Genesis because controllers state is invisible for cartridge on this system. One-chip ASIC was used mostly on Genesis3 and very late Genesis2 revision.
- Some SMS games may refuse to work if external Mega-CD is installed.

- 32X games require 32X addon to be installed.
- Hardware MegaKey does not work with Mega-SG or if 32X is installed.
- Genesis hardware wasn't designed for using such functions as save states, there is basically no way to save audio subsystem state. By this reason using save state function in some games may result glitches or even hangs. That's why this function is provided as is and it can not be improved to be fully stable. However few simple steps may help to reduce glitches rate:

Do state saving during the pause when audio is muted.

Do not load state created in the game level if you have not enter the level yet, from the title screen for example. In this case the game will have a chance to initialize audio driver properly before state will be loaded. Save state system completely ignores audio subsystem initialization.

- In-Game menu does not work for games which do not use v-blank handler.
- In-Game menu does not work if 32x addon is installed.
